Michael Narine

The compile the code, run the following command:

```
nvcc KNNADC.cu -o KNNADC -w
```

To run the code, run the following command:

```
./KNNADC
```

To run the code and specify the k value, run the following command, and replace `x` with the desired k value:

```
./KNNADC x
```

A precompiled metafeature structure is stored result_norm.txt, however, if you want to generate the term-document pairs for another textual training dataset, change line 5 in find_term.py to the directory of the dataset and run the following command:

```
python find_term.py
```
